No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Description

Protein-tyrosine kinase (EC 2.7.1.112) ark precursor - mouse
C;Species: Mus musculus (house mouse)
C;Accession: 523231
R;Rescigno, J; Mansukhani, A.; Basilico, C.
Oncogene 6, 1909-1913, 1991
A;Title: A putative receptor tyrosine kinase with unique structural topology.
A;Reference number: 523251; MuID:92019811
A;Reference number: 523251; MuID:92019811
A;Reference number: 523251
A;Reference number: 523251
A;Cossion: Accession: 523251
A;Status: nucleic acid sequence not shown
A;Mesidues: 1-942 <RES>
A;Cross-references: EMBL:X59560
C;Genetics:

Patent No. 6087144
GRERAL INFORMATION:
RAPLICANT: Scadden, David T.
APPLICANT: Baker, Kevin P.
TITLE OF INVENTION: Protein Tyrosine Kinases
NUMBER OF EXQUENCES: 35
CORRESPONDENCE ADDRESS:
ADDRESSEE; Genentech, Inc.
STREET: 460 Point San Bruno Blvd
CITY: South San Francisco
STATE: California
COUNTRY: USA
                                                                                                                                                                                                                                                                                                                                                            MEDIUM TYPE: 5.25 inch, 360 kb floppy disk COMPUTER: 18M PC compatible OPERATING SYSTEM: PC-DOS/MS-DOS SOFFWARE: patin (Genentech)
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/47,314
FLING DATE: 22-MAY-1995
CLASSIFICATION DATA:
APPLICATION NUMBER: 08/170558
FILING DATE: 20-DEC-1993
PRIOR APPLICATION DATA:

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 34,

```
RNA was isolated from peripheral lymphocytes and converted to CDNA using a C-beta-specific primer. The CDNA was amplified by anchored PCR using C-beta and polyC primers, then amplified again using a different C-beta specific primer. The amplified product was SacII-restricted, inserted into Bluescript SK+ vector and used to transform E.coli XL-lblue. Transformants were screened with a C-beta specific probe and DNA from positive clones was sequenced in the C-beta region. The sequence designated "IGR b 08" corresponds to a 5' extension of the clones VB12A1 and PL25 which are two of the previously identified members of the V beta 5 subfamily. The peptide encoded by it can be used to block T cell epitopes and in vaccines. See also Q28173-Q2828.
                                          Variable regions of b-chain of T-lymphocyte receptors and their DNA - useful as immuno:modulant(s) and for diagnosing immune disorders
                                                                                                                                        Claim 7; Page 43; 75pp; French.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes an expression vector (I) comprising a nucleic acid segment encoding a recombinant protein for interfering with nucleic acid segment encoding a recombinant protein for interfering with incorporation of native Vpr/ypx into HIV-1 or HIV-2 virion or a chimeric protein that is incorporated into an HIV-1 or HIV-2 virion or a chimeric protein that is incorporated into an HIV-1 or HIV-2 virion or prokaryotic cell transformed with (I); (2) a composition for reducing infectivity of HIV-1 or HIV-2 in vitro comprising an effective amount of (I) in association with a pharmaceutically acceptable carrier; and (3) a composition for targeting into an HIV-1 or HIV-2 virion comprising an effective amount of (I) in association with a pharmaceutically acceptable carrier. (I) has anti-HIV activity and can pharmaceutically acceptable carrier. (I) has anti-HIV activity and can be used in gene therapy. (I) is useful for reducing infectivity of HIV in vitro and for targeting into an HIV-1 or HIV-2 virion. The present sequence represents the Vpr protein from an HIV-1 strain, which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ċ

NNA was isolated from peripheral lymphocytes and converted to cDNA using a C-beta-specific primer. The cDNA was amplified by anchored PCR using C-beta and POLYC primers, then amplified again using a different C-beta specific primer. The amplified product was SacII-restricted, inserted into Bluescript SK+ vector and used to transform E coli XL-iblue. Transformants were screened with a C-beta specific probe and DNA from positive clones was sequenced in the C-beta region. The sequence designated "ICR b 09" corresponds to a 5' extension of the clones VB12A1 and PL25 which are two of the previously identified members of the V beta 5 subfamily. The peptide encoded by it can be used to block T cell epitopes and in vaccines. See also Q28173-Q28228.

The R protein is capable of trans-activating a desired heterologous prod. e.g. chloramphenicol acetyl transferase (CAT) in a wide range of expression systems. The HIV strains MAL and BRV can also be used as sources of the HIV active gene (Vpr). However strains HXBc2, BH5 and BH10 do not encode fully functional vpr proteins. See also R1074.

Gaps
The present sequence is the native Vpr protein from the HIV-1 LAI strain isolate, which can be used in the development of a chimmeric mol. comprising the present sequence and another mol., pref. a HIV infectivity or replication reducing protein fragment, i.e. a RNase and/or protease, a virion assembly and/or morphogenesis steric hindrance inducer and/or an affector of a viral protein interaction responsible for viral infectivity and/or replication. The chimmeric mol. can be specifically targetted into the mature HIV-1 virion, to affect its structural organisation and/or
                                                                                                                                                                                                                                                               ρλ
                                                                                                                                                                                                                               functional integrity, i.e. gene therapy of HIV-1 infection. Vpr protein fragments can also be used to prevent viral replication interfering with the protein interactions responsible for Vpr incorporation into the mature HIV-1 genome.

```
The present sequence represents a human secreted protein. Human secreted activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional activity, cytokine and cell proliferation/differentiation activity, haematopolesis regulating activity, tissue growth activity activity, chemotactic/chemokinetic activity, and thrombolytic activity, receptor/ligand activity, and thrombolytic activity, receptor/ligand activity, and tumour invasion suppressor activity, and tumour invasion suppressor activity, and tumour inhibition activity. The polynucleotides are also stated to be useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; Delta7-sterol reductase; hereditary; Smith-Lemli-Opitz syndrome; diagnosis; screening; double bond removal; 7-dehydrocholesterol;
                                                                                                                                                                             New polynucleotides encoding secreted human proteins derived from, e.g. fetal brain potentially used as immunostimulators

                                  Flavobacterium balustinum. The product of the invention is useful in detergent compositions for use in cold temperature wash water. The characterization of the polynucleotide facilitates the production of an alternative relatively large source of cold active protease.
                                                                                                                               Gaps
                           This invention describes a novel cold active protease, CP70 from

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This sequence represents a secreted human protein encoded by the gene clone detailed in the descriptor line. The gene can be used to generate this on proteins by linking to the gene to a human immunoglobulin FC portion (e.g. x27302) for increasing the stability of the fused protein as compared to the human protein only.

The invention relates to 123 novel genes and their fragments (nucleic acid sequences: X27311-X27449; amino acid sequences Y02650-Y02788) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polynucleotides. Specific uses are described for each of the 133 polynucleotides, based on which tissues they are most highly expressed in (see X27311 for described
                                                                                                                                                                                                                                                                                                                       Moore PA;

                                                                                                                                                                                                                                                                                                                  X30724 to X30946 represent genomic DNA sequences isolated from Streptococcus pneumoniae strain 0100993. These genomic DNA sequences encode the novel proteins given in Y11114 to Y11367. The proteins, isolated from Streptococcus pneumoniae, can be used in vaccines against streptococcal infections and in assays for identifying compounds that inhibit or activate the activity of the proteins. The antagonists can be used to treat an individual having need to inhibit a bacterial protein. Vectors expressing the proteins can be used to induce a protective immune response in mammals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

This invention describes novel isolated Streptococcus pneumoniae polynucleotides (see 296173-296494) and their encoded proteins (see 196792-196182). The DNA, vectors and host cells described in the method of the invention are useful for the recombinant expression of the polypeptides. The polypeptides are useful for treatment or prevention of disease, or diagnosis of disease related to expression or activity of such a polypeptide. They can also be used to screen for compounds which interact with and inhibit or activate such a polypeptide. The polypeptides (or DNA encoding them, via gene therapy) are also useful for inducing an immunological response in a mammal. The antagonists are useful to inhibit such bacterial polypeptides. The polypeptides are particularly useful to determine their role in pathogenesis of infection, dysfunction and disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                Gaps
                                           A novel 7-transmembrane receptor (W12695) has been identified as a human G-protein parathyroid hormone (PTH) receptor, designated HLTDG74. It shows 48.2% homology to the human PTH receptor. Its amino acid sequence was deduced from a cDNA clone (T56619) isolated from a human T cell lymphoma tissue cDNA library. Recombinant HLTDG74 can be produced in transformed host cells and used to screen for (ant)agonist cpds. Agonists may be used to prevent or treat e.g. hypocalcaemia, hyperphosphataemia, hypoparathyroidism and chronic tetany by stimulating an increase in serum calcium levels. Antagonists can be used to inhibit the receptor e.g. for the treatment of osteoporosis, hypercalcaemia, hypoparathyroidism, hypophosphataemia, kidney stone, nephroliasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       DNA encoding mammalian axl receptor having tyrosine kinase activity - useful in diagnosis and treatment of tumours
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CDNA clone (T02583) isolated from normal human fibroblast IMR-90

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A transforming gene in the DNA of patients with chronic myelogenous leukaemia was used to generate explant tumour cells in nude mice. Clone 1-4 (see T02582) isolated from a cDNA library of a tumour explant encoded the novel axl receptor (R85753), which has carrivity involved in the progression of CML to acute phase leukaemia. Recombinant, soluble and chimeric proteins based on the axl receptor have been produced in mammalian and insect host
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            DNA encoding mammalian axl receptor having tyrosine kinase activity - useful in diagnosis and treatment of tumours
